Ketoprofen Transdermal in Lipoderm

Medication:

Ketoprofen in Lipoderm

Use:

Ketoprofen is used to treat inflammation and to provide analgesia or eliminate pain.

Side Effects:

This product may cause local irritation to the site of administration after it is applied. If this occurs, patients should discontinue use of the medication and notify their physician or pharmacist. Patients may also experience a feeling of warmth or coolness. This is considered normal and does not indicate an allergic reaction.

Precautions:

This product may contain soy. Persons allergic or sensitive to egg whites may have skin reactions to this product. Patients should not use this medication if they are hypersensitive to ketoprofen or any other nonsteroidal, anti-inflammatory agents, such as aspirin, ibuprofen or ketoprofen (brand names include AdvilTM, NuprinTM, AleveTM, Orudis KTTM, and ActronTM).

Directions:

Patients should use this medication as directed by their physician or pharmacist. Patients should apply the medication to clean areas of the skin.

Storage:

This medication should be stored out of the reach of children, at controlled room temperature, protected from air and light.

For any questions, either talk to your healthcare provider or your pharmacist.
